

→ character arrays / strings

→ multi-dimensional array (2D-array)

Pointer type-casting: same as normal type-casting

difference is, pointer<sup>type</sup>s are represented  
with additional \*,

— (void\*) also exists

} uses

References / Reference variable / func. with ref. variables

Returning pointers from function =

Array and its relation with pointers.

Pointer Arithmetic.

Bubble Sort, Selection sort using functions ?? HW

Q. Why we need to pass the size of an array to a func. ??

→ when we pass array to a function, it's passed as a pointer to (arr, arr[0]).

⇒ it has no information about the no. of elements.

Post-increment  $\neq$  Pre-increment

$a++$

$\downarrow$   
 $a += 1$   
 $\swarrow$   $a$  should increase by one

$a = 5$

$x = \underline{a++};$

$\Downarrow$

$x = a;$   
 $a += 1;$

first use the value, then inc.

$++a$

$\downarrow$   
 $a += 1;$

$a = 5$

$x = ++a;$

$\Downarrow$

$a += 1;$   
 $x = a$

difference ??

when to increase

Operator Precedence  
Associativity !!

first inc.,  
then use the value.

Same for  $a--$  and  $--a$ ;

$$\text{r7} \quad \frac{a++}{++a'} \Rightarrow \boxed{a++1}$$

Square Root

$$1 \rightarrow 1 \quad 10 \rightarrow \underline{\underline{10}}$$

$$2 \rightarrow 1$$

$$3 \rightarrow 1$$

$$4 \rightarrow 2$$

$$5 \rightarrow 2$$

$$6 \rightarrow 2$$

Nearest power of 2.

$$\underline{1, 2, 4, 8, 16, 32, 64, 128, \underline{\underline{256}}}$$

N ← nearest

abs difference minimum

$N > 1, 2, 3, 4, 5, 6, 7, 8; 9, 10, 11, 12, 13, 14, 15, 16$

Square root  $\rightarrow 1, 2, 3, 4, 5, 6, \dots$  — Sq. root

$\rightarrow$  iterate from  $i=1$  onwards, no. of steps unknown

and simply check whether the number is less than  $(i+1)^2$

if yes then  $\rightarrow$   $i$  is the output  
else,  $i++$

<u>Sq. root</u>	<u><math>N</math></u>	
1	$< 4$	$2^2$
2	$< 9$	$3^2$
3	$< 16$	$4^2$
4	$< 25$	$5^2$
		$\vdots$

$i=1$   $(2^2) \times$

$i=2$   $(3^2) \times$

$i=3$   $(4^2) \leftarrow$   
 $\rightarrow$  ans

loop

while

Print → 1, 2, 4, 8, 16, 32, 64, 128, 256, 512

{ max exponent of (2),  $2^n$   
which is less/equal, to N }

N can be  $2^n$  ←

or can be b/w  $2^{n-1}$   $2^n$

$$\underline{2^{n-1}} \xrightarrow{\times 2} \underline{2^n}$$

N → nearest -  $(2^{n-1}, 2^n)$

Character Arrays

Strings

sequence of chars / symbols

an array of chars

char a[40];

a[0] = "H"

a[1] = "e"

a[2] = "l"

a[3] = "l"

Sequence of chars  
words  
sentence

Can i use  
character  
array??

a[4] = "o"

Strings : are stored / behind the scenes are char arrays.

∴ we have derived data type known as strings.

to represent the char [] in a  
more subtle way, we made  
a string data-type

⇓  
a sequence of chars

↓  
behaves like char []

— also has some more  
features

In C/C++, every string is simulated (behind-the-scenes) using char arrays. -----

char []  $\Leftrightarrow$  strings

they are almost same thing.

Q. Can we deduce, why we can store a string (" ") in a char []. ??

→ Convention: Strings always end with NULL character  
(ascii  $\rightarrow$  0) ('\0')

null character ('0') marks the end of a string

String: sequence of chars

- implemented using `char[]`
- always ends with '\0'

Observe: `char array` behaves as a string during input/output.

char array  $\Leftrightarrow$  string : cout : treats a char array as a string

Overloaded  $\Leftrightarrow$  not as an array.

`int arr[5] = {1, 2, 3, 4, 5};`

cout << arr;  $\swarrow$  address

char str[5] = {"h", "e", "l", "l", "o"};

char \*

with

characters / some rubbish

not the address

str  $\Rightarrow$  (char \*)

↓ cout

not  
address

↓  
not-  
address

cout <= str;

not as an array

output

Hello

cout treated this char[]  
as a string and prints  
it collectively.

→ cout treats, char address (char[], char\*) differently

→ if we give it any other address (int, bool, double, ...) it just  
prints the address.

→ It will print each character byte-by-byte, until it finds a '\0',

(char → 1 byte)

&str → 100

cout << str;

cout << \*(100);

\*(101);

\*(102);

\*(103);

⋮

until the char is null.

cout << str;

\*str;

\*(str+1);

\*(str+2);

⋮

until '\0',

→ it doesn't care about the size of array / space-allocated.

char[] are treated as strings, and strings end with '\0'.

cout prints char[] until a null char, which is to be found at the end of string.

char str[] = "welcome\0"

str	W	e	e	c	o	m	e	\0
	0	1	2	3	4	5	6	7

size=8

necessary

cout << str;  $\Rightarrow$  welcome

character arrays behave as a string ( sep. of chars ends with '\0' )

Input to a char array

Q. Check palindrome using function.

Q. Read  $N$ , and then  $N$  strings, and print the largest

Q. Write a function to rotate a string by  $k$ .  
Shift right by one place

input: Hello  $\Rightarrow$  eello : output  
 $k=3$
